

## **INTRODUCTION**

KS0070B is a dot matrix LCD driver & controller LSI which is fabricated by low power CMOS technology. It is capable of displaying 1 or 2 lines with the 5×7 format or 1 line with the 5×10 dots format.

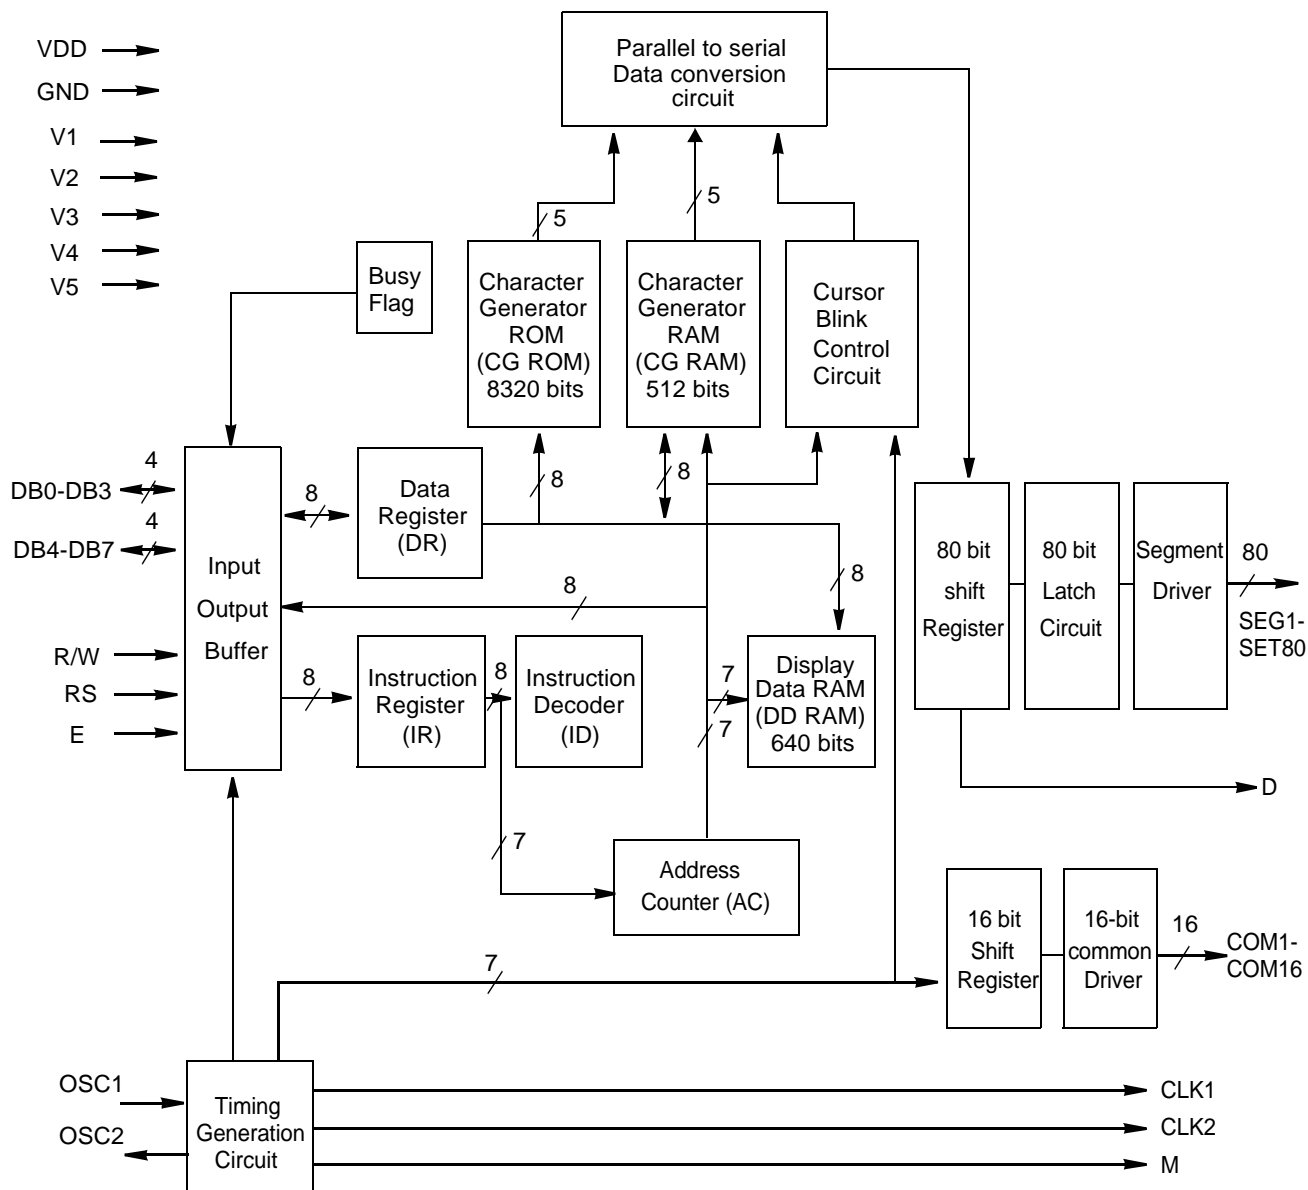

## **FUNCTIONS**

- Character type dot matrix LCD driver & controller
- Internal driver: 16 common and 80 segment signal output
- Easy interface with 4-bit or 8-bit MPU
- Display character pattern: 5×7 dots format (192 kinds) & 5×10 dots format (32 kinds)
- The special character pattern is directly programmable by the character generator RAM.
- A customer character pattern is programmable by mask option.
- It can drive a maximum of 80 characters by using the KS0065B or KS0063B externally.
- Various instruction functions
- Built-in automatic power on reset
- Driving method is A-type (Line inversion)

## **FEATURES**

- Internal Memory
  - Character Generator ROM (CGROM): 8,320 bits (192 characters × 5 × 7 dots)  
& (32 characters × 5 × 10 dots)
  - Character Generator RAM (CGRAM): 64 × 8 bits (8 characters × 5 × 7 dots)
  - Display Data RAM (DDRAM): 80 × 8 bits (80 characters max.)
- Low power operation
  - Power supply voltage range: 2.7 to 5.5 V (VDD)
  - LCD Drive voltage range: 3.0 to 10.0 V (VDD to V5)
- Supply voltage for display: 0 to -5 V (V5)
- Programmable duty cycle: 1/8, 1/11, 1/16
- Internal oscillator with an external resistor
- Bare chip or bumped chip available

## PAD DESCRIPTION

Pad No. (Normal/Mirror)	Input/ Output	Name	Description	Interface
VDD (54/50)	-	Power supply	For logical circuit (+3 V, + 5 V)	Power Supply
VSS(35, 69)			0 V (GND)	
V1 ~ V5 (42~46/62~58)			Bias voltage level for LCD driving.	
SEG1 ~ SEG80 (34~2, 128~82/ 70~128, 2~22)	Output	Segment output	Segment signal output for LCD drive.	LCD
COM1 ~ COM16 (66~81/38~23)	Output	Common output	Common signal output for LCD drive.	LCD
OSC1, OSC2 (37, 36/67, 68)	Input (OSC1)/ Output (OSC2)	Oscillator	When using internal oscillator, connect external Rf resistor. If external clock is used, connect it to OSC1.	External resistor/ oscillator (OSC1)
CLK1, CLK2 (47, 48/57, 56)	Output	Extension driver Latch (CLK1)/Shift (CLK2) clock	Each outputs extension driver latch clock and extension driver shift clock.	Extension driver
M (49/55)	Output	Alternated signal for LCD driver output	Outputs the alternating signal to convert LCD driver waveform to AC.	Extension driver
D (50/54)	Output	Display data interface	Output extension driver data (the 41st dot's data)	Extension driver
RS (51/53)	Input	Register select	Used as register selection input. When RS = "1", Data register is selected. When RS = "0", Instruction register is selected.	MPU
RW (52/52)	Input	Read/Write	Used as read/write selection input. When RW = "1", read operation. When RW = "0", write operation.	MPU
E (53/51)	Input	Read/Write enable	Used as read. Write enable signal.	MPU
DB0~DB3 (55~58/49~46)	Input / Output	Data bus 0~7	When 8-bit bus mode, used as low order bidirectional data bus. During 4-bit bus mode open these pins.	MPU
DB4~DB7 (59~62/45~42)			When 8-bit bus mode, used as high order bidirectional data bus. In case of 4-bit bus mode, used as both high and low order. DB7 used for Busy Flag output.	MPU
TEST (63/41)	Input	Test Pin	This pin must be fixed to VDD or open.	—

## FUNCTION DESCRIPTION

### System Interface

This chip has both kinds of interface type with MPU: 4-bit bus and 8-bit bus.  
4-bit bus and 8-bit bus are selected by the DL bit in the instruction register.

During read or write operation, two 8-bit registers are used. One is the data register (DR), and the other is the instruction register (IR).

The data register (DR) is used as a temporary data storage place for being written into or read from DDRAM/CGRAM. Target RAM is selected by RAM address setting instruction. Each internal operation, reading from or writing into RAM, is done automatically.

After MPU reads DR data, the data in the next DDRAM/CGRAM address is transferred into DR automatically. Also, after MPU writes data to DR, the data in DR is transferred into DDRAM/CGRAM automatically.

The Instruction register (IR) is used only to store instruction codes transferred from MPU. MPU cannot use it to read instruction data.

To select a register, use RS input pin in 4-bit/8-bit bus mode.

**Table 1. Various Kinds of Operations According to RS and R/W bits.**

RS	R/W	Operation
0	0	Instruction Write operation (MPU writes Instruction code into IR)
0	1	Read Busy flag (DB7) and address counter (DB0 ~ DB6)
1	0	Data Write operation (MPU writes data into DR)
1	1	Data Read operation (MPU reads data from DR)

### Busy Flag (BF)

When BF = "1", it indicates that the internal operation is being processed. So during this time the next instruction cannot be accepted. BF can be read, when RS = "0" and R/W = "1"

(Read Instruction Operation), through DB7 port.

Before executing the next instruction, be sure that BF is not "1".

Address Counter (AC)

The Address Counter (AC) stores DDRAM/CGRAM addresses, transferred from IR. After writing into (reading from) DDRAM/CGRAM, AC is automatically increased (decreased) by 1. When RS = "0" and R/W = "1", AC can be read through ports DB0~DB6.

Display Data RAM (DDRAM)

DDRAM stores display data of maximum 80 x 8 bits (80 characters). DDRAM address is set in the address counter (AC) as a hexadecimal number. (Refer to Fig-1.)

Fig-1. DDRAM Address

1) 1-line display

In the case of a 1-line display, the address range of DDRAM is 00H ~ 4FH. An Extension driver will be used. Fig-2 shows the example when a 40-segment extension driver is added.

2) 2-line display

In the case of a 2-line display, the address range of DDRAM is 00H ~27H and 40H ~ 67H. An Extension driver will be used. Fig-3 shows the example when a 40 segment extension driver is added.

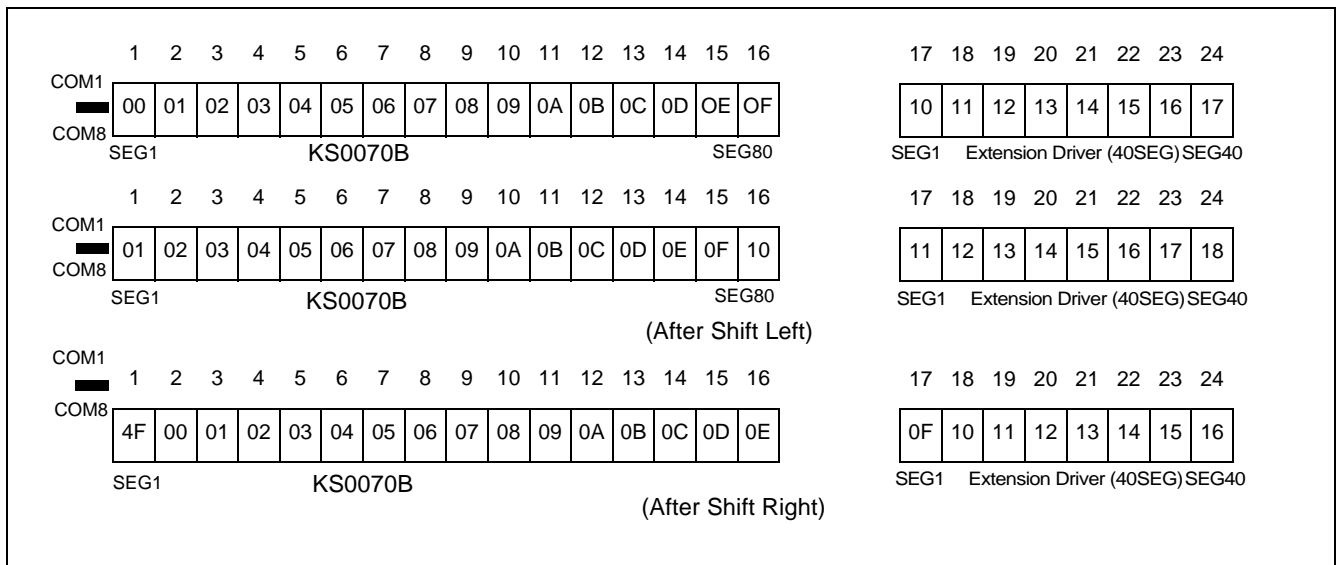

Fig-2. 1-line 24ch. Display With 40 SEG. Extension Driver.

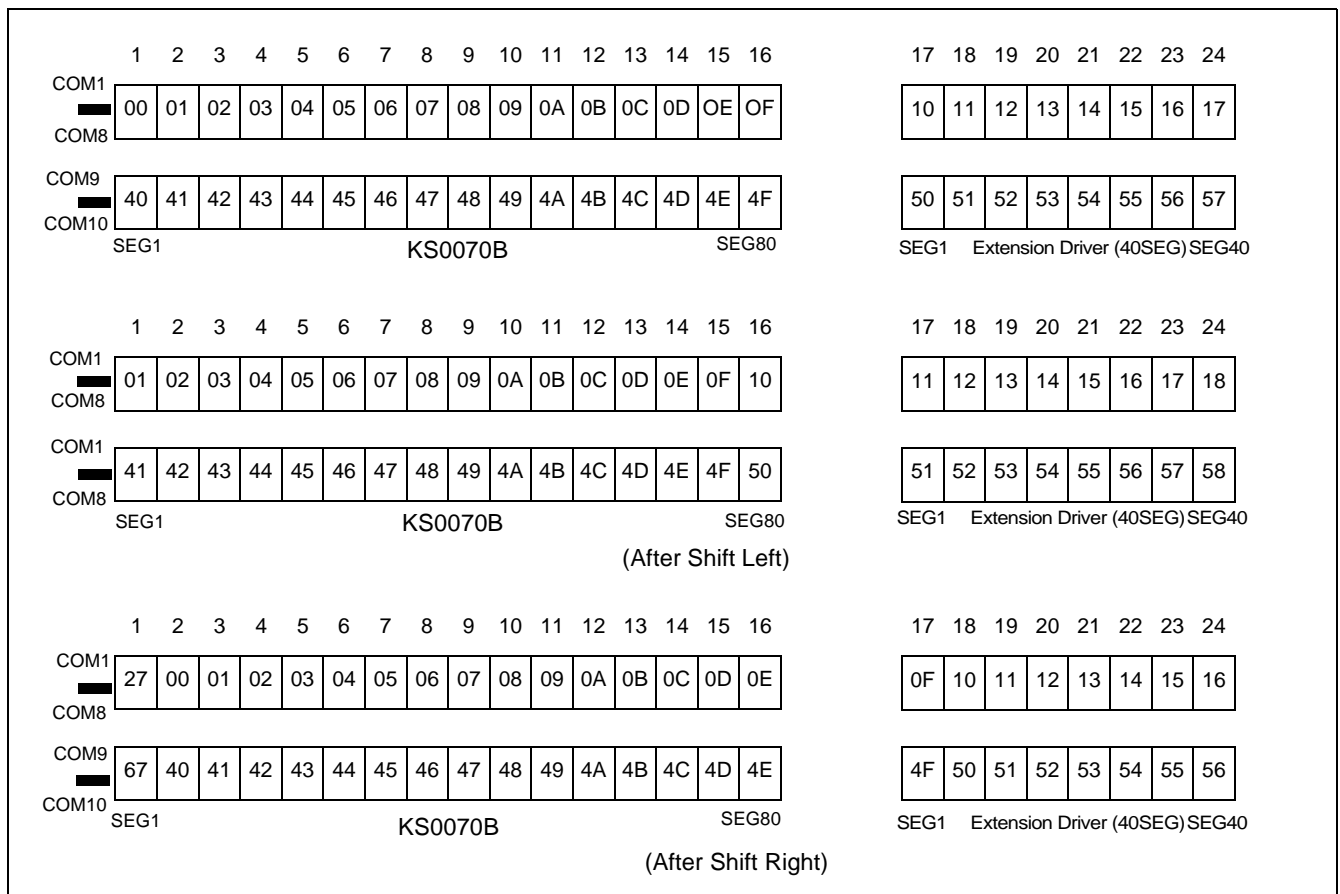

Fig-3. 2-line 24ch. Display With 40 SEG. Extension Driver.

**CGROM (Character Generator ROM)**

CGROM has a  $5 \times 7$ -dot 192 character pattern, and a  $5 \times 10$ -dot 32 character pattern (Refer to Table 2).

**CGRAM (Character Generator RAM)**

CGRAM has up to  $5 \times 8$ -dot 8 characters. By writing font data to CGRAM, user defined characters can be used (Refer to Table 3).

**Timing Generation Circuit**

Timing generation circuit generates clock signals for the internal operations.

**LCD Driver Circuit**

LCD Driver circuit has 16 common and 80 segment signals for LCD driving.

Data from CGRAM/CGROM is transferred to an 80-bit segment latch serially, and then stored to an 80-bit shift latch. When each com is selected by a 16-bit common register, segment data is also output through the segment driver from an 80-bit segment latch.

In the case of a 1-line display mode, COM1 ~ COM8 have 1/8 duty or COM1 ~ COM11 have a 1/11 duty. In a 2-line display mode, COM1 ~ COM16 have a 1/16 duty ratio.

**Cursor/Blink Control Circuit**

It controls cursor/blink ON/OFF at cursor position.

Table 2. CGROM Character Code Table

## INSTRUCTION DESCRIPTION

### Outline

To overcome the speed difference between the internal clock of KS0070B and the MPU clock, KS0070B performs internal operations by storing control information to IR or DR. The internal operation is determined according to the signal from MPU, composed of read/write and data bus (Refer to Table 5).

Instruction can be divided largely into four kinds:

- (1) KS0070B function set instructions ( set display methods, set data length, etc.)
- (2) address set instructions to internal RAM
- (3) data transfer instructions with internal RAM
- (4) others .

The address of the internal RAM is automatically increased or decreased by 1.

\* NOTE: During internal operation, Busy Flag (DB7) is read "1". Busy Flag check must be preceded by the next instruction.

When you make an MPU program with checking the Busy Flag (DB7), it must be necessary  $1/2 F_{osc}$  for executing the next instruction by falling E signal after the Busy Flag (DB7) goes to "0".

### Contents

#### 1) Clear Display

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	1

Clear all the display data by writing "20H" (space code) to all DDRAM addresses, and set the DDRAM addresses to "00H" in the AC (address counter). Return cursor to original status, namely, bring the cursor to the left edge on first line of the display. Make entry mode increment (I/D = "1").

#### 2) Return Home

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	x

Return Home is the cursor return home instruction.

Set DDRAM address to "00H" in the address counter. Return cursor to its original site and return display to its original status, if shifted. Contents of DDRAM does not change.

## 3) Entry Mode Set

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	I/D	SH

Set the moving direction of cursor and display.

I/D : Increment / decrement of DDRAM address (cursor or blink)

When I/D = "1", cursor/blink moves to right and DDRAM address is increased by 1.

When I/D = "0", cursor/blink moves to left and DDRAM address is decreased by 1.

\* CGRAM operates the same as DDRAM, when reading from or writing to CGRAM.

**SH: Shift of entire display**

When DDRAM is in read (CGRAM read/write) operation or SH = "0", shift of entire display is not performed.

If SH = "1" and in DDRAM write operation, shift of entire display is performed according to I/D value (I/D = "1": shift left, I/D = "0": shift right).

## 4) Display ON/OFF Control

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	C	B

Control display/cursor/blink ON/OFF 1-bit register.

**D : Display ON/OFF control bit**

When D = "1", entire display is turned on.

When D = "0", display is turned off, but display data remains in DDRAM.

**C : Cursor ON/OFF control bit**

When C = "1", cursor is turned on.

When C = "0", cursor disappears in current display, but I/D register retains its data.

**B : Cursor Blink ON/OFF control bit**

When B = "1", cursor blink is on, which performs alternately between all the "1" data and display characters at the cursor position.

When B = "0", blink is off.

## 5) Cursor or Display Shift

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	×	×

Without writing or reading the display data, shift right/left cursor position or display.

This instruction is used to correct or search display data.(Refer to Table 4)

During 2-line mode display, cursor moves to the 2nd line after the 40st digit of the 1st line.

Note that display shift is performed simultaneously in all the lines.

When displayed data is shifted repeatedly, each line shifts individually.

When display shift is performed, the contents of the address counter are not changed.

**Table 4. Shift Patterns According to S/C and R/L bits**

S/C	R/L	Operation
0	0	Shift cursor to the left, AC is decreased by 1
0	1	Shift cursor to the right, AC is increased by 1
1	0	Shift all the display to the left, cursor moves according to the display
1	1	Shift all the display to the right, cursor moves according to the display

## 6) Function Set

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	N	F	×	×

**DL : Interface data length control bit**

When DL = "1", it means 8-bit bus mode with MPU.

When DL = "0", it means 4-bit bus mode with MPU. So to speak, DL is a signal to select 8-bit or 4-bit bus mode.

When 4-bit bus mode, it needs to transfer 4-bit data in two parts.

**N : Display line number control bit**

When N = "0", it means 1-line display mode.

When N = "1", 2-line display mode is set.

**F : Display font type control bit**

When F = "0", 5 × 7 dots format display mode

When F = "1", 5 × 10 dots format display mode.

## 7) Set CGRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

Set CGRAM address to AC.

This instruction makes CGRAM data available from MPU.

## 8) Set DDRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0

Set DDRAM address to AC.

This instruction makes DDRAM data available from MPU.

When in 1-line display mode ( $N = 0$ ), DDRAM address is from '00H' to '4FH'.

In 2-line display mode ( $N = 1$ ), DDRAM address in the 1st line is from '00H' to '27H', and DDRAM address in the 2nd line is from '40H' to '67H'.

## 9) Read Busy Flag &amp; Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0

This instruction shows whether KS0070B is in internal operation or not. If the resultant BF is "1", it means the internal operation is in progress and you have to wait until BF is Low. Then the next instruction can be performed. In this instruction you can also read the value of the address counter.

## 10) Write data to RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	D7	D6	D5	D4	D3	D2	D1	D0

Write binary 8-bit data to DDRAM/CGRAM.

The selection of RAM from DDRAM, and CGRAM, is set by the previous address set instruction : DDRAM address set, and CGRAM address set. RAM set instruction can also determine the AC direction to RAM. After write operation, the address is automatically increased/decreased by 1, according to the entry mode.

## 11) Read data from RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	D7	D6	D5	D4	D3	D2	D1	D0

Read binary 8-bit data from DDRAM/CGRAM.

The selection of RAM is set by the previous address set instruction. If the address set instruction of RAM is not performed before this instruction, the data that is read first is invalid, because the direction of AC is not determined. If you read RAM data several times without RAM address set instruction before read operation, you can get correct RAM data from the second, but the first data would be incorrect, because there is no time margin to transfer RAM data. In the case of DDRAM read operation, cursor shift instruction plays the same role as DDRAM address set instruction; It also transfers RAM data to the output data register.

After read operation the address counter is automatically increased/decreased by 1 according to the entry mode. After CGRAM read operation, display shift may not be executed correctly.

\* In the case of RAM write operation, after this AC is increased/decreased by 1 like read operation. At this time, AC indicates the next address position, but you can read only the previous data by the read instruction.

Table 5. Instruction Table

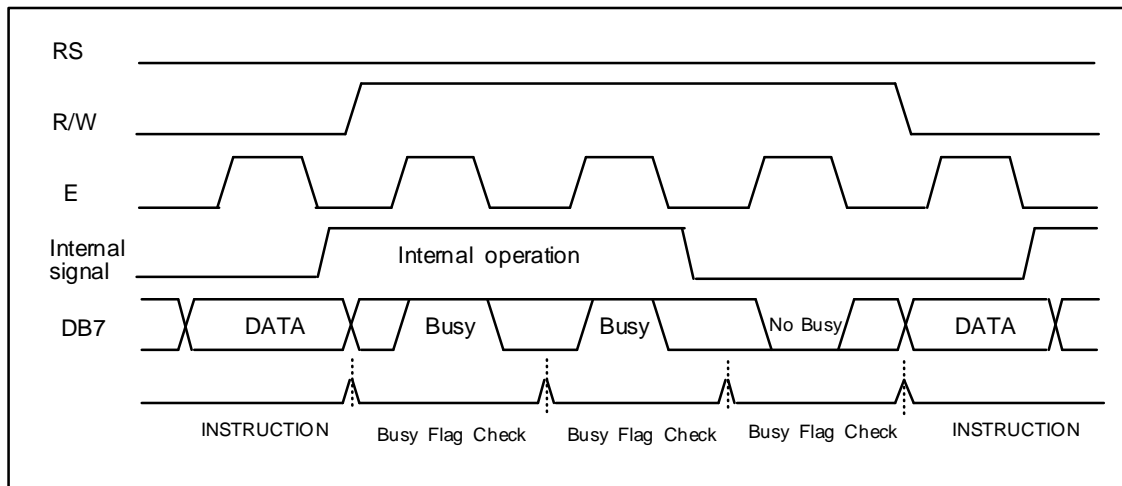

Instruction	Instruction Code										Description	Execution Time (fosc = 270 kHz)
	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0		
Clear Display	0	0	0	0	0	0	0	0	0	1	Write "20H" to DDRAM and set DDRAM address to "00H" from AC.	1.53 ms
Return Home	0	0	0	0	0	0	0	0	1	x	Set DDRAM address to "00H" from AC and return cursor to its original position if shifted.	1.53 ms
Entry Mode Set	0	0	0	0	0	0	0	1	I/D	SH	Assign cursor moving direction and enable the shift of entire display .	39 $\mu$ s
Display ON/OFF Control	0	0	0	0	0	0	1	D	C	B	Set display (D), cursor (C), and blinking of cursor (B) on/off control bit.	39 $\mu$ s
Cursor or Display Shift	0	0	0	0	0	1	S/C	R/L	x	x	Set cursor moving and display shift control bit, and the direction, without changing of DDRAM data.	39 $\mu$ s
Function Set	0	0	0	0	1	DL	N	F	x	x	Set interface data length (DL : 4-bit/8-bit), numbers of display line (N : 1-line/2-line, Display font type (F:0 ...)	39 $\mu$ s
Set CGRAM Address	0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0	Set CGRAM address in address counter.	39 $\mu$ s
Set DDRAM Address	0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Set DDRAM address in address counter.	39 $\mu$ s
Read Busy flag and Address	0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Whether during internal operation or not can be known by reading BF. The contents of address counter can also be read.	0 $\mu$ s
Write Data to RAM	1	0	D7	D6	D5	D4	D3	D2	D1	D0	Write data into internal RAM (DDRAM/CGRAM).	43 $\mu$ s
Read Data from RAM	1	1	D7	D6	D5	D4	D3	D2	D1	D0	Read data from internal RAM (DDRAM/CGRAM).	43 $\mu$ s

\* NOTE : When you make an MPU program with checking the Busy Flag (DB7), it must be necessary  $1/2F_{osc}$  for executing the next instruction by falling E signal after the Busy Flag (DB7) goes to "0".

## INTERFACE WITH MPU

### 1) Interface with 8-bit MPU

When interfacing data length are 8-bit, transfer is performed all at once through 8 ports, from DB0 to DB7. An Example of the timing sequence is shown below.

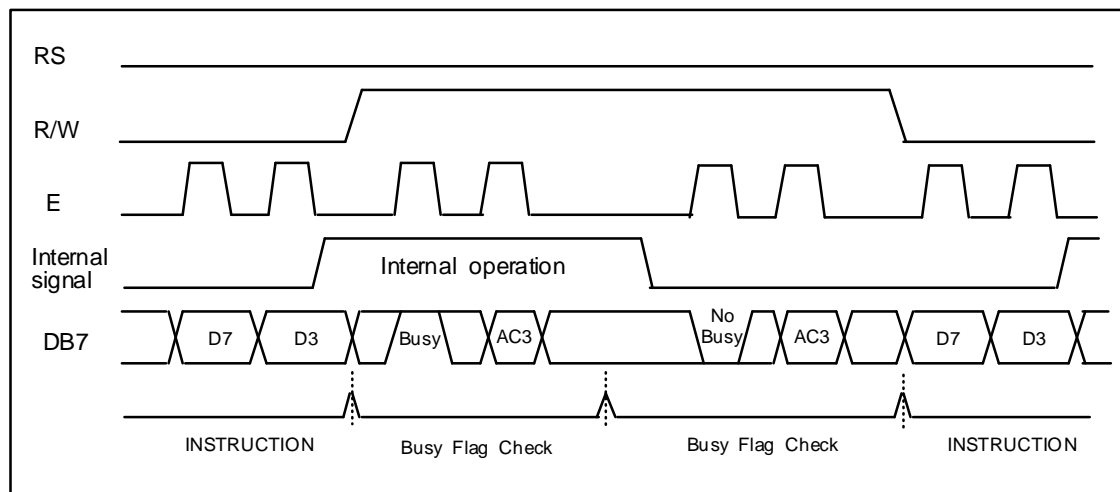

**Fig-4. Example of 8-bit Bus Mode Timing Diagram**

### 2) Interface with 4-bit MPU

When interfacing data length are 4-bit, only 4 ports, from DB4 to DB7, are used as data bus.

At first, higher 4-bit (in case of 8-bit bus mode, the contents of DB4 - DB7) are transferred, and then the lower 4-bit (in case of 8-bit bus mode, the contents of DB0 - DB3) are transferred. So transfer is performed in two parts. Busy Flag outputs "1" after the second transfer are ended.

Example of timing sequence is shown below.

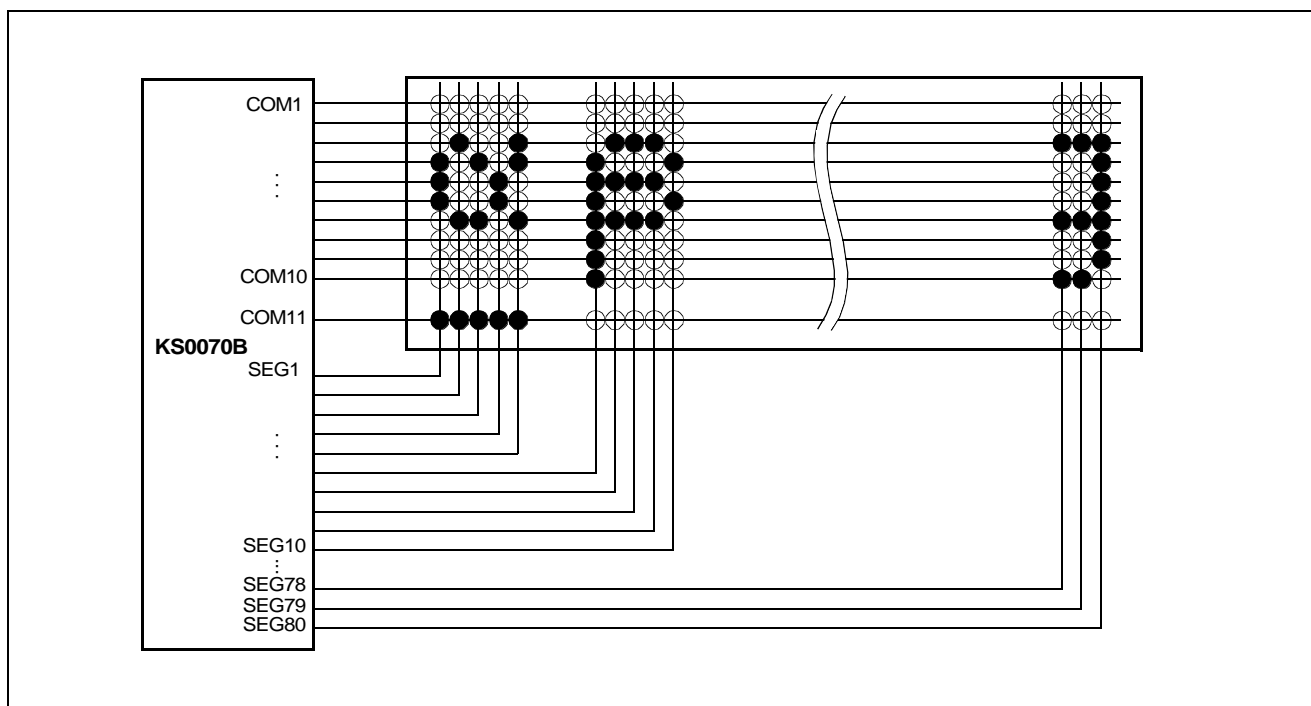

**Fig-5. Example of 4-bit Bus Mode Timing Diagram**

## APPLICATION INFORMATION ACCORDING TO LCD PANEL

1) LCD Panel: 16 characters  $\times$  1-line format (  $5 \times 7$  dots + 1 cursor line 1/4 bias, 1/8 duty)

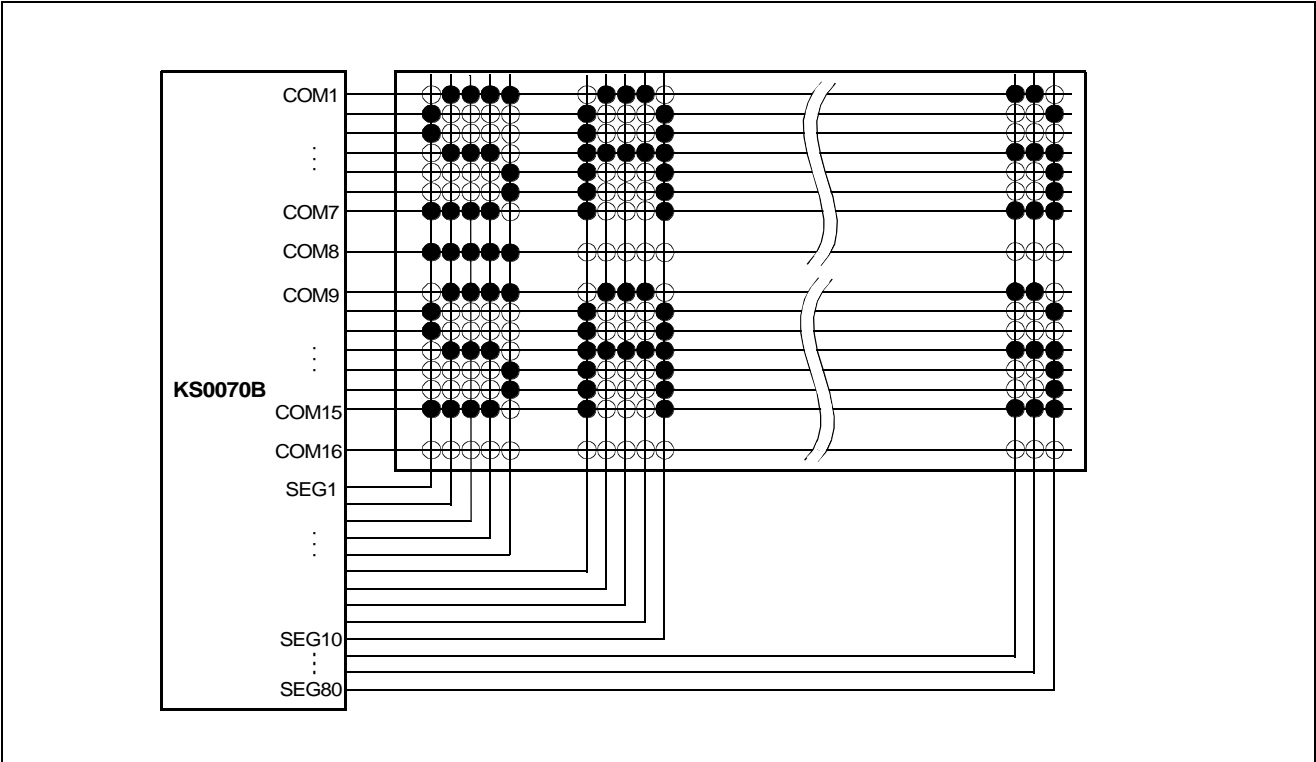

2) LCD Panel: 16 characters  $\times$  1-line format (  $5 \times 10$  dots + 1 cursor line 1/4 bias, 1/11 duty)

3) LCD Panel : 16 character × 2-line format: ( 5 × 7 dots + 1 cursor line 1/5 bias, 1/16 duty)

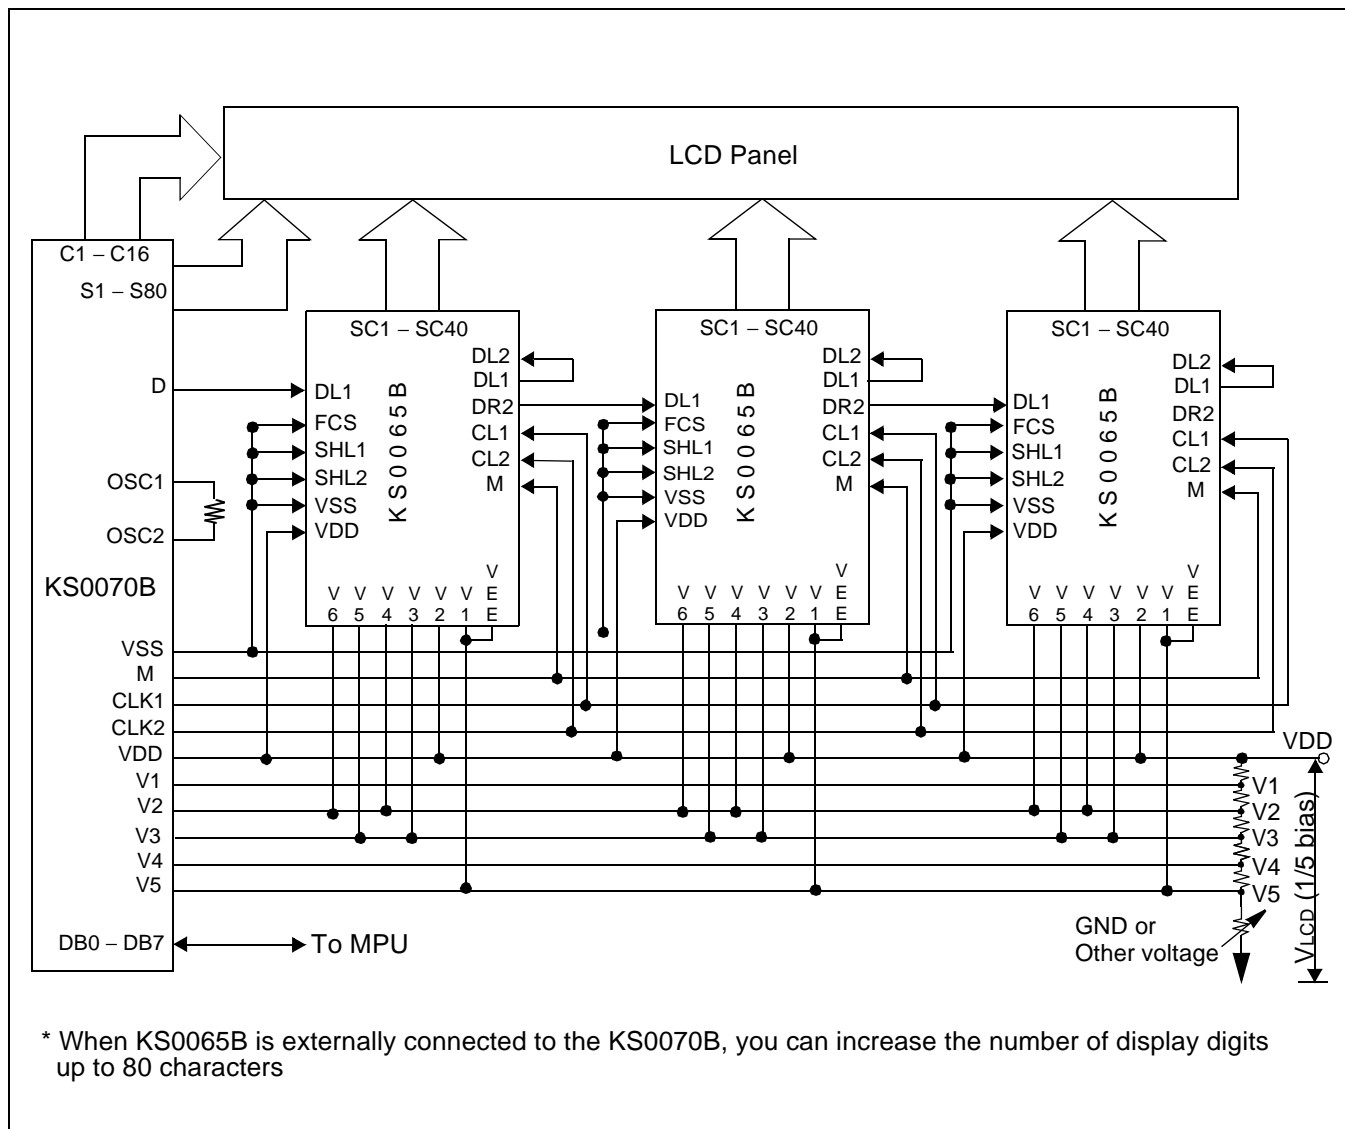

4) LCD Panel : 32 character × 1-line format: ( 5 × 7 dots + 1 cursor line 1/5 bias, 1/16 duty)

5) LCD Panel : 8 character  $\times$  2-line format: (  $5 \times 7$  dots + 1 cursor line 1/4 bias, 1/8 duty)

## APPLICATION CIRCUIT

**BIAS VOLTAGE DIVIDE CIRCUIT**

1) 1/4 bias, 1/8 OR 1/11 duty

2) 1/5 bias, 1/16 OR 1/11 duty

**INITIALIZING**

When the power is turned on, KS0070B is initialized automatically by the power on reset circuit. During the initialization, the following instructions are executed, and BF(Busy Flag) is kept "1"(busy state) to the end of initialization.

- (1) Display Clear instruction  
Write "20H" to all DDRAM
- (2) Set Functions instruction  
DL = 1 : 8-bit bus mode  
N = 0 : 1-line display mode  
F = 0 : 5×7 font type
- (3) Control Display ON/OFF instruction  
D = 0 : Display OFF  
C = 0 : Cursor OFF  
B = 0 : Blink OFF
- (4) Set Entry Mode instruction  
I/D = 1 : Increment by 1  
SH = 0 : No entire display shift

FRAME FREQUENCY

1) 1/8 duty cycle

A) A-type Waveform

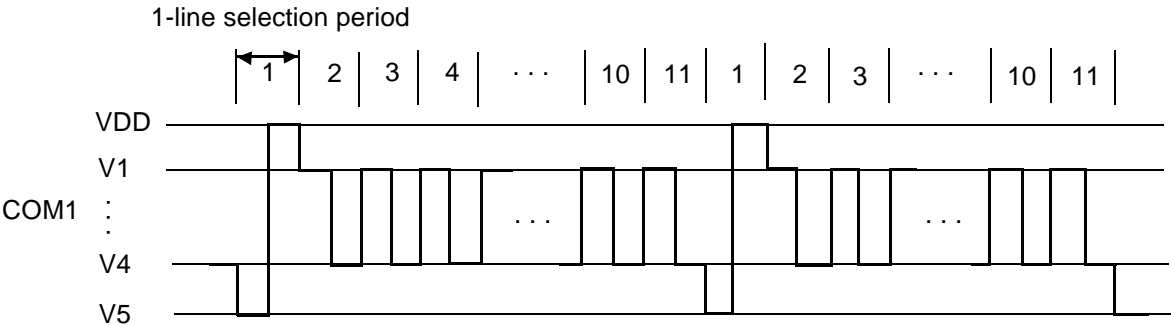

Item	Clock / Frequency
Line selection period	400 clocks
Frame frequency	84.4 Hz

\* fosc=270 kHz (1 clock = 3.7  $\mu$ s)

2) 1/11 duty cycle

A) A-type Waveform

Item	Clock / Frequency
Line selection period	400 clocks
Frame frequency	61.4 Hz

\* fosc=270 kHz (1 clock = 3.7 μs)

3) 1/16 duty cycle

A) A-type Waveform

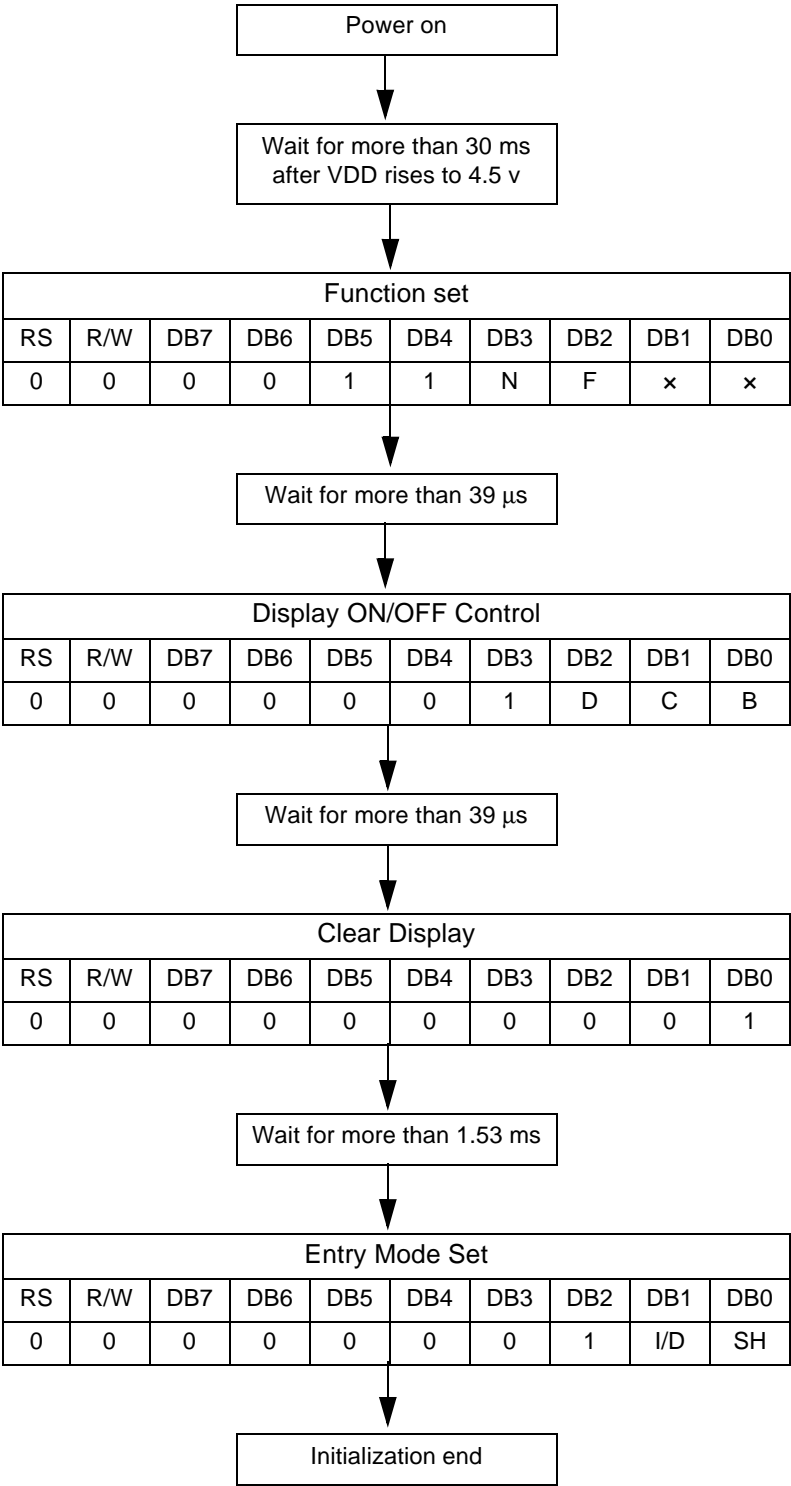

Item	Clock / Frequency
Line selection period	200 clocks
Frame frequency	84.4 Hz

\* fosc=270 kHz (1 clock = 3.7 μs)

INITIALIZING BY INSTRUCTION

1) 8-bit interface mode

Condition: fosc=270 kHz

N	0	1-line mode
	1	2-line mode

F	0	5 × 7 dots
	1	5 × 10 dots

D	0	display off
	1	display on

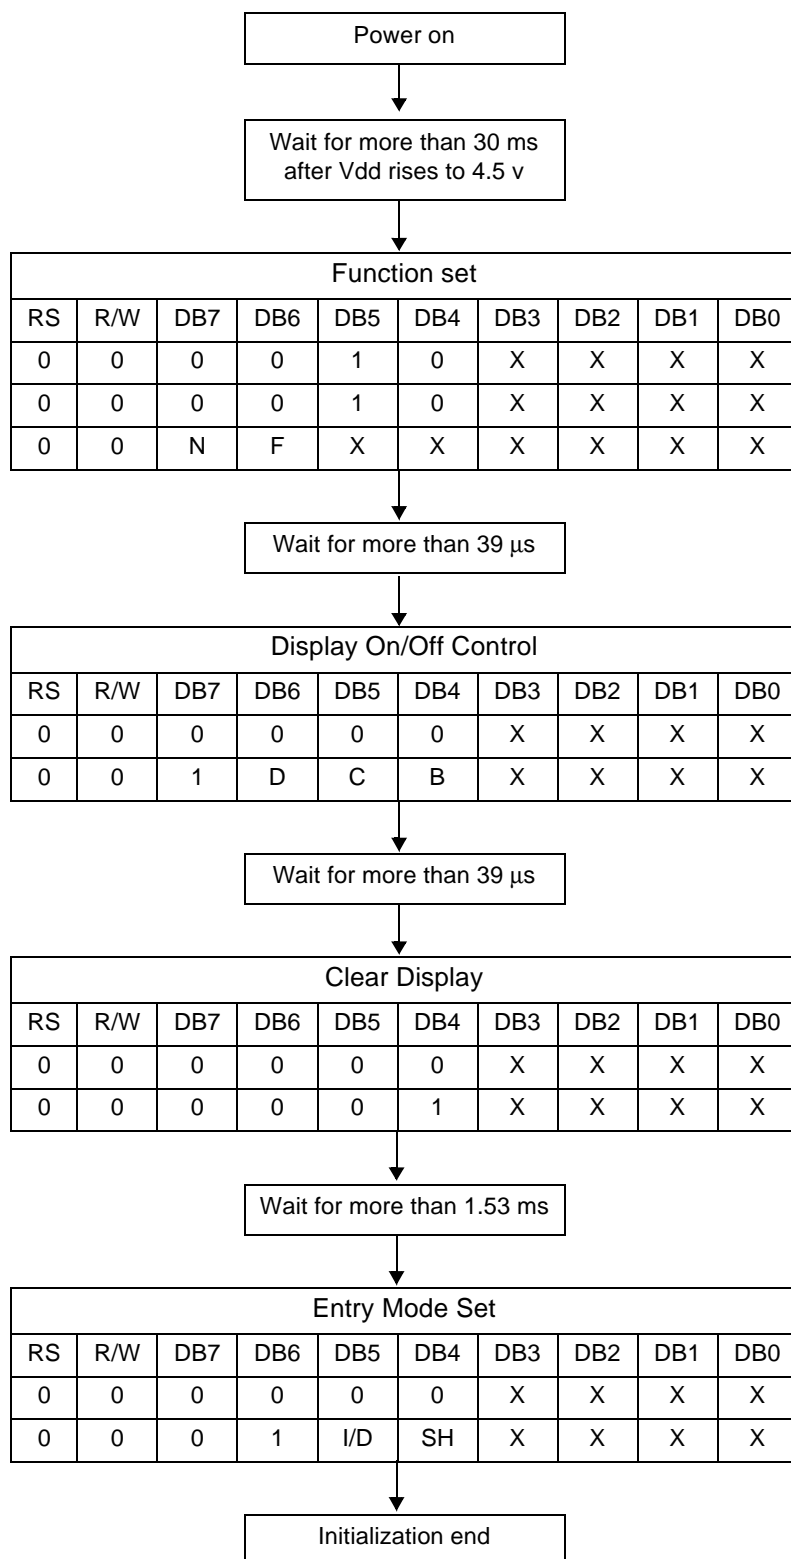

C	0	cursor off
	1	cursor on

B	0	blink off
	1	blink on

I/D	0	decrement mode
	1	increment mode

SH	0	entire shift off
	1	entire shift on

## 2) 4-bit interface mode

Condition: fosc=270 kHz

N	0	1-line mode
	1	2-line mode

F	0	5 × 7 Dots
	1	5 × 10 Dots

D	0	display off
	1	display on

C	0	cursor off
	1	cursor on

B	0	blink off
	1	blink on

I/D	0	decrement mode
	1	increment mode

SH	0	entire shift off
	1	entire shift on
